

Volunteer Water Quality Monitoring Program Report of 2008 Sampling Data

**Township of The Archipelago
April 2009**

Acknowledgements

This monitoring program represents a successful partnership between the Township of The Archipelago, cottager associations, and numerous volunteers in areas along the coast and inland lakes that has lasted since its inception in 1999. The volunteer-based program provides an important avenue for relaying information about our environment to ratepayers and for providing valuable information to the Township.

We owe continued thanks to all the volunteers who commit time and resources toward the ongoing success and long term vision that is water quality monitoring. Additionally, we are grateful to the ongoing support and interest of Dr. Karl Schiefer who provides advice on various technical aspects of the program and continues to be passionate about environmental quality on the Georgian Bay coast and inland waters.

The Township wishes to thank all of you for your passion and drive to ensure our high quality environment is maintained.

Report Compiled by Greg Mason, Georgian Bay GENERATIONS and the Township of The Archipelago

1.0 Introduction

This report provides the summary of results from the 2008 Water Quality Monitoring Program for the Township of The Archipelago. The program purpose, rationale, and methods have been presented in previous year's reports and were followed for the 2008 season. Similar to past reports, the purpose here is to present the data gathered in the 2008 sampling season in detail but also to indicate summaries of past year's results to enable comparison of ongoing trends. It should be noted that this report was created by Township of The Archipelago staff and by Greg Mason of Georgian Bay GENERATIONS and no analysis or review is provided internally. An additional Water Quality Review is available from the Township. For information on this report and/or the volunteer water quality monitoring program in The Archipelago, please contact Ted Thompson at the Township of The Archipelago.

A draft report of some recent studies, completed by Ngan Diep of the Ministry of Environment, are available at the Township of The Archipelago. This work focused on the eastern coast of Georgian Bay and provides a better understanding of the changing water quality from open Georgian Bay into inner bays. It also looked into water quality differences between undeveloped and developed areas of the Bay. As well, The Archipelago commissioned Dr. Karl Schiefer to complete a comprehensive water quality review of the inland lakes; this report is also available through the Township office.

The Township is very committed to addressing environmental issues and ensuring the maintenance of the high quality environment we all enjoy. This philosophy is integrated into the day to day functioning of the municipality from public works operations to detailed planning analysis.

2.0 Results

The following results were tabulated from data gathered in 2008. Different locations were sampled with different intensity and for varying lengths of time. It is not the purpose of this report to provide analysis or draw conclusions from the data. Rather, what is provided are:

- outlines of the standards against which data can be compared; and
- tables outlining the different data sets and averages for each location for each sample area; and where possible, the averages from the previous sampling years.

It should be noted that in order to assess the relevance of the data, comparisons should be made between averages and standard deviations (not individual data points per se), previous year averages and against established standards.

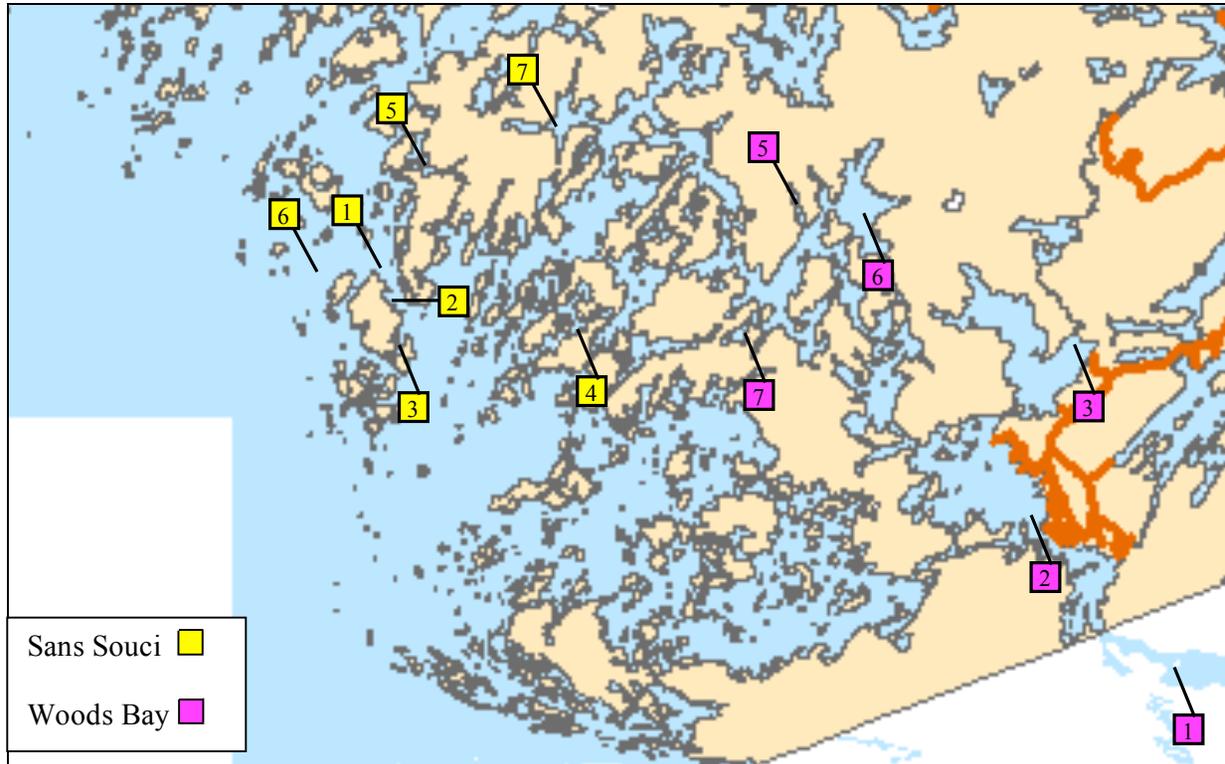

Charts are provided comparing water quality in the inland lakes, open bay sampling areas, and back bay sampling areas. When reviewing these data please keep in mind similarities and differences in the surrounding ecosystem and potential differences in sampling methodology (i.e. sampling times).

2.1 Sample Locations

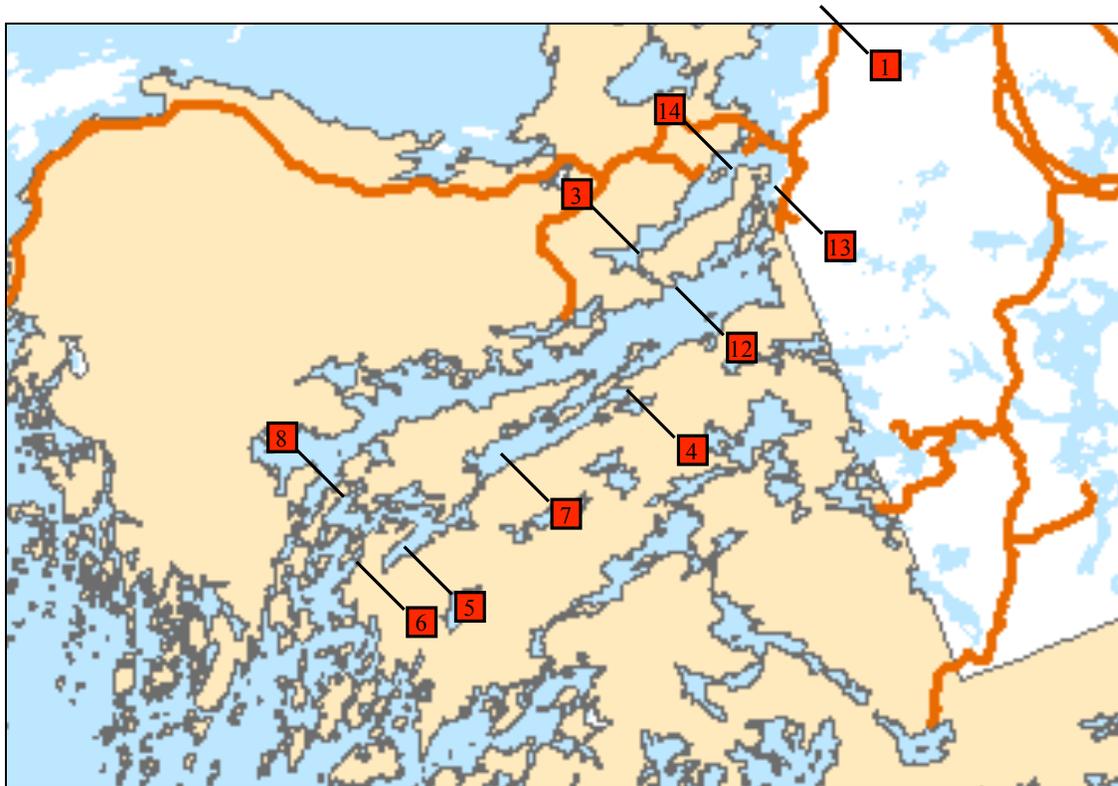

Sampling sites have typically been focused on known or expected “hot spots”; areas that may be more likely to suffer water quality impairment related to human activities. Some sample areas have also been selected as control stations; these allow comparison between the variety of ecosystem types that exist along the coast and within inland lakes. Maps of the sample areas indicate the sampling locations for the different areas throughout the township. The sample sites include many of the sampling stations used in

previous years and volunteers are encouraged to return to those sites in subsequent years. Unlike previous years, results for the different parameters are shown in table format, not on individual maps; refer to the maps when positioning the different samples.

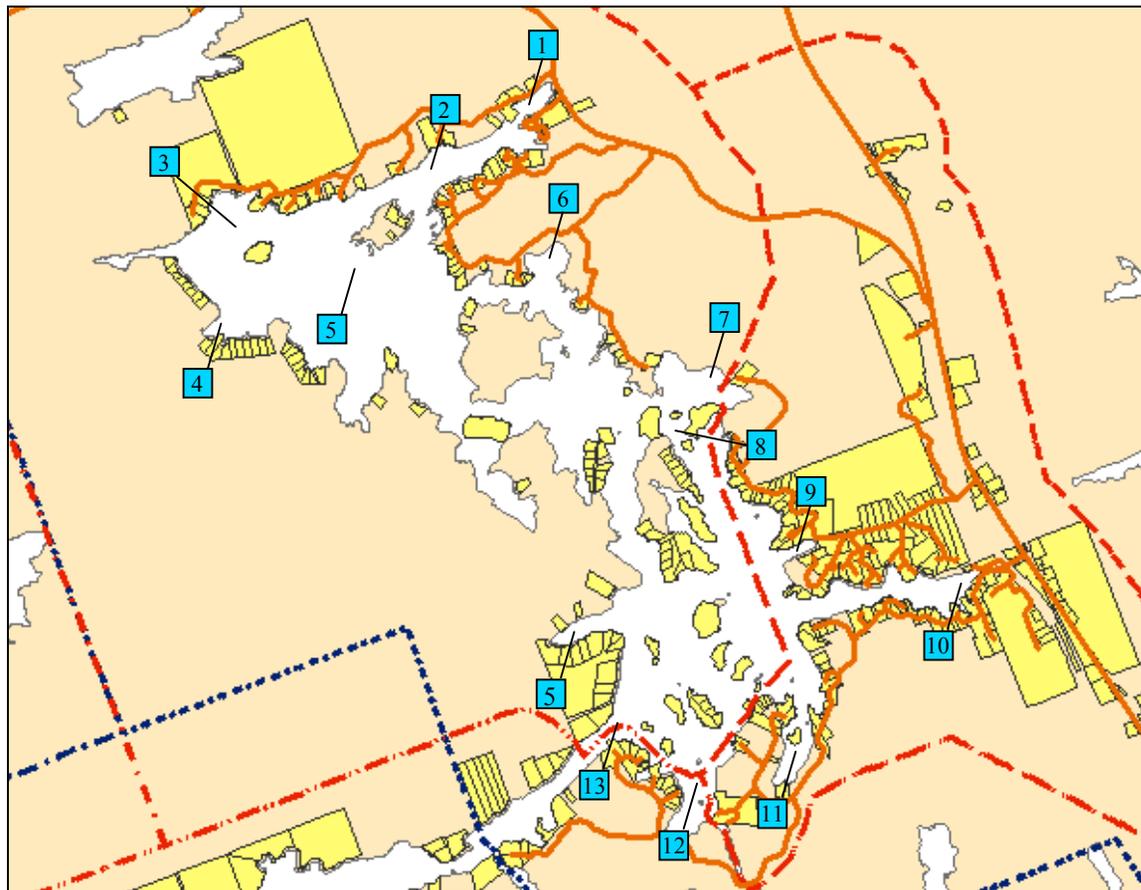

2.1.1 Sans Souci and Woods Bay Sampling Locations

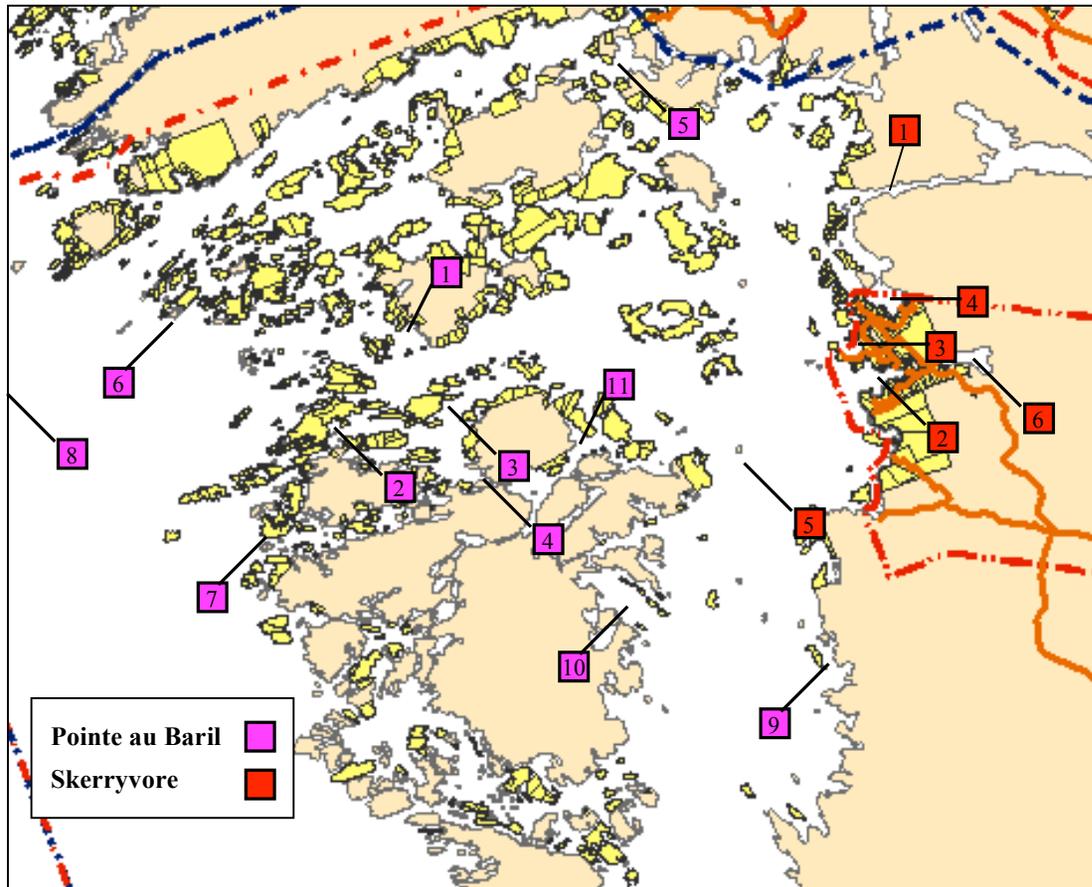

2.1.2 South Channel Sampling Locations

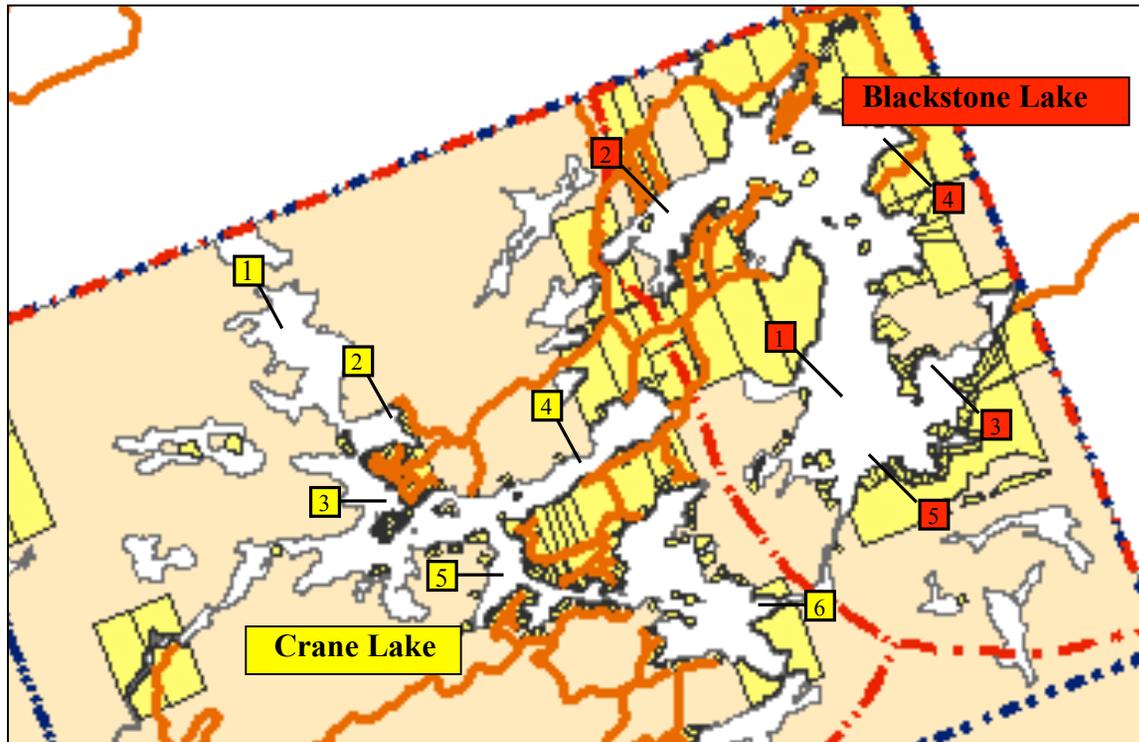

2.1.3 Sturgeon Bay Sampling Locations

2.1.4 Skerryvore and Pointe au Baril Islands Sampling Locations

2.1.5 Blackstone and Crane Lake Sampling Locations

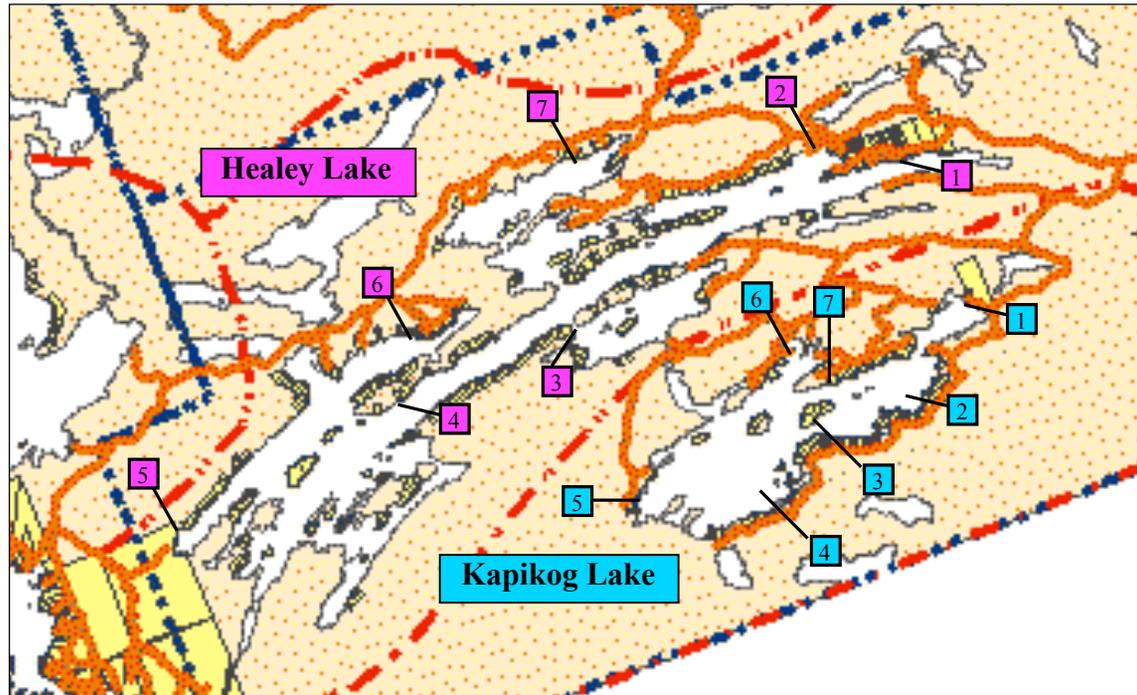

Blackstone Lake Sampling Sites:

- | | | |
|----------------------------------|-----------------|-------------------|
| 1 Centre of Lake (Peanut Island) | 2 McRoberts Bay | 3 Lawson Bay(old) |
| 4 Blackstone Landing | 5 Mallet | |

Crane Lake Sampling Sites:

- | | | |
|---------------------|--------------------------|----------------------------------|
| 1 North End | 2 Goebel's Bay | 3 Aga Ming Private Dock/Mead Bay |
| 4 Crane Lake Resort | 5 Overflow Bay (Narrows) | 6 South End |

2.1.6 Healey Lake and Kapikog Lake Sampling Locations

2.1.7 Naiscoot Lake Sampling Locations

2.2 Water Clarity

Water clarity is usually measured using a black-and-white Secchi disc which is lowered into the water until it just disappears from view. This depth is the Secchi depth of visibility, which is directly related to water clarity and can be used as a simple yet effective monitoring tool for determining the effects of human activities on water clarity and, indirectly, on eutrophication. In general, water clarity, as measured by Secchi depth, tends to be higher in open areas of Georgian Bay and in bays with good water circulation. Water clarity tends to diminish (smaller Secchi depth values) in enclosed bays, near wetlands or sources of organic material, and in lakes or areas that may naturally be more nutrient enriched. When examining the data, expect to see a small decline in Secchi depth throughout the year with lowest depths reading near the end of the summer and into September, however a major decline in the readings should be evaluated more carefully. A multi-year comparison of data is of particular value here to assess the water clarity trends for a particular area and where possible, data from previous years have been included with the tables.

2.3 Bacterial Monitoring

Results of bacterial monitoring in a number of locations of the Township of The Archipelago are provided by location in this section of the report

2.3.1 Bacterial Reference Guidelines and Objectives

The following bacterial guidelines and objectives are provided to assist in the interpretation of bacterial monitoring results presented in this report.

Provincial Regulatory Guideline levels for total coliforms (TC) are as follows:

- 1,000 – levels higher than this are considered unsuited for recreational water use;
- 200 – levels higher than this are considered to be indicative of deteriorating water quality; and
- 10 – levels higher than this are considered unsafe for human consumption

NOTE: total coliforms are no longer used as a regulatory guideline in Provincial Water Quality Objectives. Total coliform levels have been found to be too variable and are largely considered to be a natural component of ecosystems

The objectives for *E. coli* (EC) are as follows:

- 100 – levels higher than this are considered unsuited for recreational water use
- 0 – levels higher than this are considered unsafe for human consumption without prior treatment.

NOTE: provincial bacterial levels are to be based on a geometric mean of five samples taken in the same local area at the same time.

Based on a number of years of intensive bacterial monitoring throughout the Township of Georgian Bay and the Township of The Archipelago, the following has been recommended as a suggested bacterial objective for recreational waters of Georgian Bay and the associated inland lakes:

- **Total Coliforms (annual average):** - **100 TC**
- ***E. Coli* (annual average):** - **10 EC**

The following tables present the data by sample area for each sampling location and date within that area. A calculated standard deviation and average is presented for each sample locations and an average of all sampling locations for each general area is also provided.

Recent heavy rain events are indicated by (**) beside the sampling dates and medium to light recent rain events are indicated by (*) beside each sample date.
